

Remarks

Applicant respectfully requests that this Amendment After Final Action be admitted under 37 C.F.R. § 1.116.

Applicant submits that this Amendment presents claims in better form for consideration on appeal. Furthermore, applicant believes that consideration of this Amendment could lead to favorable action that would remove one or more issues for appeal.

Claims 1, 7, 13 and 20 have been amended. No claims have been canceled. Therefore, claims 1-24 are now presented for examination.

Claims 1, 2 and 4-24 stand rejected under 35 U.S.C. §103(a) as being unpatentable over BOCCON-GIBOD (2001/0016836) in view of Angelo (U.S. Patent No. 5,944,821).

Applicant submits that the present claims are patentable over any combination of BOCCON-GIBOD and Angelo.

BOCCON-GIBOD discloses system and method of distributing music and video signals over a network. The system includes a client. The client includes client helper software having a client manager module, playback module, codec units, encryption/decryption modules, key store, key store lock and device manager. The playback module communicates with the codec units to decompress music and video content before playback. See BOCCON-GIBOD at [0025 – 0026]. However, BOCCON-GIBOD does not disclose or suggest an integrity agent. In fact, the Examiner admits that BOCCON-GIBOD does not disclose an integrity agent. See Final Office Action at page 3, section 2.

However, the Examiner asserts that Angelo discloses such an integrity agent. Angelo discloses a computer system that incorporates the capability to protect against the execution of unauthorized or modified code in real time. A secure hash table is provided that contains a secure hash value for each program that the user wants to track. The hash table is stored in

Docket No. 42P10448

Application No. 09/821,271

protected memory that can only be accessed when the computer system is in a system management mode. Execution of a secured application is then predicated on its current hash value matching a corresponding hash value in the secure hash table. When a user attempts to execute a secured application, a system management interrupt (SMI) is generated. The SMI places the computer system in a system management mode, causing an SMI handler routine to be executed. The SMI handler first generates a current hash value for the program to be executed. Next, the SMI handler checks the stored hash table for an entry for the secured application. If a hash value entry is found, it is compared with the newly-calculated hash value for the secured application. In the event the two values match, the integrity of the application is guaranteed and it is loaded into memory and executed. For security-sensitive applications, the entire application or a portion of it is loaded into system management mode memory (hereinafter "SMM memory") prior to running the execution. If the two values do not match, the user is alerted to the discrepancy and may be given the option to update or override the stored hash table entry by entering an administrative password. See Angelo at col. 4, ll. 26 – col. 5, ll. 5.

Claim 1 of the present application recites:

A computer system comprising:
a compressor/decompressor (codec);
a system module having one or more functions
called by the codec to render compressed content; and
an integrity agent to enforce conditions of use for
the received content by examining a first voucher
describing the integrity of the codec and a second
voucher describing the integrity of the one or more
functions that are to be accessed by the codec.

Applicant submits that there nowhere in Angelo is there a disclosure or suggestion of
an integrity agent to enforce conditions of use for content received at a computer system.

Instead, Angelo discloses the capability of protecting against the execution of unauthorized

Docket No. 42P10448

Application No. 09/821,271

or modified code. Nevertheless, protecting against the execution of unauthorized or modified code is not equivalent to enforcing conditions of use for received content.

Since neither BOCCON-GIBOD nor Angelo disclose or suggest an integrity agent to enforce conditions of use for content received at a computer system, any combination of BOCCON-GIBOD and Angelo would also not disclose or suggest such a feature. Moreover, nowhere in either cited reference is there disclosed or suggested a codec that calls one or more functions to render compressed content. Thus, claim 1 is patentable over BOCCON-GIBOD in view of Angelo.

Claims 2-6 depend from claim 1 and include additional features. Therefore, claims 2-6 are also patentable over BOCCON-GIBOD in view of Angelo.

Claim 7 recites:

A trusted player comprising:
a compressor/decompressor (codec); and
an integrity agent to enforce conditions of use for content received at the trusted player by examining a first voucher describing the integrity of the codec and a second voucher describing the integrity of the one or more functions that are to be accessed by the codec.

Thus, for the reasons described above with respect to claim 1, claim 7 is also patentable over BOCCON-GIBOD in view of Angelo. Since claims 8-12 depend from claim 7 and include additional features, claims 8-12 are also patentable over BOCCON-GIBOD in view of Angelo.

Claim 13 recites:

A method comprising:
receiving content at a compressor/decompressor (codec);
calling a function of a first component of a system module from the codec to assist in decoding the digital content;
intercepting the function call to the first component

of the system module at an integrity agent in order to enforce conditions of use of the content; and

verifying the authenticity of the first component of the system module at the integrity agent by computing a digest of a memory image of the first component.

Thus, for the reasons described above with respect to claim 1, claim 13 is also patentable over BOCCON-GIBOD in view of Angelo. In addition, Applicant submits that BOCCON-GIBOD nor Angelo not disclose or suggest computing a digest of a memory image of a first component. Accordingly, claim 13 is patentable over BOCCON-GIBOD in view of Angelo. Because claims 14-19 depend from claim 13 and include additional features, claims 14-19 are also patentable over BOCCON-GIBOD in view of Angelo.

Claim 20 recites:

An article of manufacture including one or more computer readable media that embody a program of instructions for verifying the authenticity of one or more functions utilized by a compressor/decompressor (codec) to assist in decoding the digital content, wherein the program of instructions, when executed by a processing unit, causes the processing unit to:

call a function of a first component of a system module from the codec;

intercept the function call to the first component of the system module in order to enforce conditions of use of the content; and

verify the authenticity of the first component of the system module at the integrity agent by computing a digest of a memory image of the first component.

Thus, for the reasons described above with respect to claim 13, claim 20 is also patentable over BOCCON-GIBOD in view of Angelo. Since claims 21-24 depend from claim 20 and include additional features, claims 21-24 are also patentable over BOCCON-GIBOD in view of Angelo.

Claim 3 stands rejected under 35 U.S.C. §103(a) as being unpatentable over BOCCON-GIBOD (2001/0016836) in view of Angelo (U.S. Patent No. 5,944,821) in view Docket No. 42P10448
Application No. 09/821,271

of Reid (U.S. Patent No. 5,844,575). Applicant submits that the present claims are patentable over BOCCON-GIBOD in view of Angelo and Reid.

Reid discloses an apparatus and for method for asynchronous compression of video information in a computer system. See Reid at Abstract. Nonetheless, Reid does not disclose or suggest an integrity agent to enforce conditions of use for content received at a computer system. As discussed above, BOCCON-GIBOD and Angelo fail to disclose or suggest an integrity agent to enforce conditions of use for content received at a computer system. Therefore, any combination of BOCCON-GIBOD, Angelo and Reid would also fail to disclose or suggest such a feature. As a result, the present claims are patentable over BOCCON-GIBOD in view of Angelo and Reid.

Applicant respectfully submits that the rejections have been overcome, and that the claims are in condition for allowance. Accordingly, applicant respectfully requests the rejections be withdrawn and the claims be allowed.

The Examiner is requested to call the undersigned at (303) 740-1980 if there remains any issue with allowance of the case.

Please charge any shortage to our Deposit Account No. 02-2666.

Respectfully submitted,
BLAKELY, SOKOLOFF, TAYLOR & ZAFMAN LLP
